

### **PART B**

Finis&Co is a small business that makes a dessert table for any events such as open house for Hari Raya, engagement day and others. Customers need to place an order at least 3 days before the event. Due to the growing size of the orders, Finis&Co decided to set up a database system that keeps track of the order's information. Finis&Co has approached you to develop such a system and below are the requirements and business rules that they need you to follow:

- The database system needs to keep track of the information of the customers such as customer ID, their first and last name, phone number, email and address.
- The staff's information such as their identification, first name, last name, and hired date need to be recorded by the system.
- The system should also be able to track the order's information in terms of the date, time and location for each event held.
- A customer can request only one package for each order. Each package will have different prices.
- A package will have several Malay's confectionery (kuih-muih) such as Kuih Talam, Kuih Seri Muka, Kuih Nyonya Manis and others.
